

SBS LAUNCHES COATED DISCS

COATED DISCS HAVE MANY ADVANTAGES

SBS Automotive extends the NK product range with coated brake discs. The coated disc offers significant visual and practical advantages. Due to the strong anticorrosive coating the disc will remain stainless for a long period. This is especially an advantage in open rims where the disc are very visible.

In addition, the coated disc does not need to be degreased before fitting saving time and costs for the repair shop.

"GREEN" COATING

The NK discs are spray coated with an environment friendly water based aluminum zinc painting, which is completely without hazardous ingredients. Coating thickness is less than 20 μ . Therefore the coating will disappear after the first break-down and will thus have no negative impact on the brake performance at all.

WIDE RANGE

The NK range covers the most popular premium and medium size car models in the European car fleet, and with approx. 500 reference numbers, it is one of the widest on the market. It will be developed successively according to demand. The coated discs are available through SBS Automotive's distribution platforms in Germany and Denmark.

MATCHING QUALITY

Like other product groups in the NK range, the coated discs are Matching Quality Parts featuring a 3-year-guarantee against material and production failures.

April 2013

SBS Deutschland GmbH

SBS Deutschland distributes brake parts and other wear parts for passenger cars and LCVs. SBS Deutschland is part of the SBS Group.
